STATION 12

A SCORING TABLE FOR 3X3 BASKETBALL

1. IN BRIEF

Station 12 is a simple, readable and standalone tool: it starts without Internet and is operated with a few big buttons and a touchscreen.
It was designed around one guiding idea: **at any moment, you should understand where the match stands without having to read or interpret anything**. Big digits, consistent team colours, a visual signal when a match could end on the next basket, and more.
It is aimed first and foremost at:

- **players with an intellectual disability**, where clear information is a matter of understanding and autonomy, for the players as well as for the volunteers running the table;
- **younger players**, for whom a tool that is easy to pick up is what matters.

2. THE PROBLEM: A DISPLAY THAT IS NOT ALWAYS CLEAR

Conventional scoreboards are often designed for athletes from mainstream sport who are already familiar with the game. Common issues include:

- digits that are small or low-contrast, hard to read from a distance;
- a lot of information shown at once (score, time, possession, fouls, period, etc.);
- heavy, expensive equipment that is hard for a beginner volunteer to operate.

For a person with an intellectual disability, for a child, or for someone discovering basketball, any one of these difficulties can be enough to make them lose track of the game.

3. THE SCREENS

3.1 THE SCOREBOARD (MAIN SCREEN)

With ***Station 12***, each team's score is shown in large digits. Game time, team fouls (and the resulting penalties: one or two free throws, regaining possession), team names and team colours are also shown on this main screen, clearly and legibly.

The scoreboard before the match and during the match.

Visual cues show the penalties linked to the number of fouls.

3.2 POSSESSION (SECOND SCREEN, OPTIONAL)

The 12-second possession clock can be shown **on its own screen**, facing the players. Players no longer have to look for this information in a corner of the court: **it is visual**.

The possession clock can have its own screen, turned towards the players.

3.3 THE PHYSICAL BUTTONS AND THE TABLE'S TOUCHSCREEN

For the table operator: each button does **one thing only**.

The table also has a touchscreen, where the match settings are entered (team names and jersey colours, custom match duration, display of tenths of a second on the possession clock, etc.). Once the match has started, only the physical buttons are used.

The operator view: big buttons and very few steps.

4. CONNECTIVITY

4.1 TWO HDMI OUTPUTS

One output drives the **main scoreboard** on a first screen, while the second is dedicated to displaying the **possession time** (see the screenshots in section 3.1).

4.2 WI-FI

Station 12 creates its own Wi-Fi network. Anyone can connect to it and open either screen directly in a web browser.

5. WHAT THE TOOL BRINGS

- **Clear information, no complex reading**. Digits and colours carry the meaning. Text is rare and short.
- **Help understanding the key moments**. When possession time is nearly up, visual signals make it easier to take in the information. The pulsing "match point" signal also makes visible a moment that is usually only announced out loud.
- **Autonomy for the team running the event**. A scoring table run by a single person is feasible.

- **Adaptable rules**. Match length, possession length, winning score and overtime margin can all be set. The game can be adjusted to the group rather than the other way round.
- **Matches with running time**. The possession clock can be stopped on its own while game time keeps running: handy for the formats common in small tournaments, where the clock is not stopped.
- **Reliable in the field**. It works without Internet; after a power cut, the score, fouls and times come back exactly where they were.
- **Low cost** and **small footprint** compared with a professional scoreboard: a few consumer-grade components.

6. PLAYER TESTIMONIALS

"I really liked the scoreboard. The scores are nice and big, and the 12 seconds are very visible, with the colour change as it gets close to zero. Overall, it is very satisfying from the court."
— Ayoub LAANAIT, French national team

"When it's next to the court, it really helps me. It lets me manage the match better and know whether I should keep the ball or attack."
— Grégory SEJOR, French national team

"The scoreboard mainly gives me a visual advantage. There are more colours, which makes the screen more pleasant to look at and the information easier to spot. For the 12 seconds, a single glance is enough to know where you are in the action. When you look for a piece of information, you find it immediately."
"The remaining time is clearly shown, and the coloured 'hourglass' lets you see at a glance how time is running out."
"When there are only three seconds left to shoot, I don't need to look directly at the scoring table: I can see the red in my field of vision. I understand immediately that less than three seconds remain and that I must make a decision quickly."
"I think this table compensates for some of the difficulties linked to our disability, in particular reading numbers, quickly locating information and perceiving the time left."
"Because the information is more visible and easier to understand, we can react faster and make better decisions during the game."
— Davy DELUSIER, French national team
